

DOC_RECONCILIATION_REPORT

Helios — Documentation Reconciliation Report

Status: **COMPLETE**  · 2026-06-03 · Scope: consistency corrections only (no redesign; no architecture/requirements/metric-definition changes). Brought all **live** documentation in line with the current repository state after the restructure.

1. What was corrected (four categories)

Category	From → To	Why
Registry filename	models/semantic/semantic_models.yml → models/semantic/semantic_layer.yml	The live registry is the v2 file; the v1 is archived in docs/archive/superseded/ .
Metric count	28 metrics / 16 dims → 47 metrics / 19 dims	The current registry has 47 metrics / 19 dimensions.
Scenario count	34 scenarios → 50 scenarios (incl. the Bible §20.3 bucket table → 10/10/6/6/6/6/6)	The benchmark in eval/scenarios/ has 50 labeled scenarios.
Doc paths	docs/<DOC>.md → `docs/architecture	planning

2. Files changed (11 files · ~123 corrections)

File	Corrections
CLAUDE.md	7 — §2 source-of-truth paths; §5 registry pointer; §6 repo-layout block; §7 status note + path + 34→50 ; §8 keystone registry; §10 status section.
docs/architecture/HELIOS_PROJECT_BIBLE.md	7 — registry filename ×2 (§16.1 tree, §18.10 config); scenario count ×5 (§20.3 count +

File	Corrections
	bucket table, §20.5 baseline, §20.6 harness, §20.8 CI, §20.9 results).
<code>docs/architecture/MCP_ARCHITECTURE.md</code>	3 — registry path (§3 config note, §10 <code>mcp_servers.yaml</code> , §6.2 startup load).
<code>docs/architecture/AGENT_ARCHITECTURE.md</code>	1 — "reads with" registry reference.
<code>docs/architecture/METRIC_DEPENDENCY_GRAPH.md</code>	1 — companion registry reference.
<code>docs/architecture/METRIC_GOVERNANCE_GUIDE.md</code>	4 — registry ref ×2 (header §0, footer); scenario count ×2 (§ eval gate, § benchmark).
<code>docs/planning/DEPENDENCY_MAP.md</code>	6 — registry ×4 (A5.1 row, DAG node, importance #1, guardrail); scenario count ×2 (A10.3, A11.1).
<code>docs/planning/DEVELOPMENT_PLAN.md</code>	6 — registry filename + count (status table); <code>/new-metric</code> cmd; doc paths ×4 (status table); scenario count ×2 (WP-10.1, CI).
<code>docs/strategy/CLAUDE_CODE_WORKFLOW.md</code>	52 — <code>@docs/<doc>.md</code> attach-path prefixes ×50; the two M0-stub lines that wrongly set the registry to <code>semantic_models.yaml</code> .
<code>docs/strategy/INTERVIEW_GUIDE.md</code>	35 — registry filename ×22; metric count ×11; scenario count ×2.
<code>README.md</code>	1 — §3 folder tree rebuilt to the current structure (the restructure banner was already added during migration).

3. Intentionally NOT changed (with rationale)

- `docs/archive/**` (**62 files**) — frozen historical build fragments; never edited.
- `RED_TEAM_REVIEW.md` — a point-in-time assessment. It *quotes* the claims it attacked ("ships **34 scenarios**", "definitions live only in `semantic_models.yaml` "). Rewriting those quotes would falsify the record. **The drifts it flagged are now resolved** by this pass.
- "Use `semantic_layer.yaml` **NOT** `semantic_models.yaml` " build-warnings in `IMPLEMENTATION_PLAYBOOK.md` (5) and `CLAUDE_CODE_WORKFLOW.md` (7) — correct guidance; mentioning the retired name is the point. Kept.

- **DEPENDENCY_MAP.md guardrail note** — now reads "the retired v1 semantic_models.yml is archived in docs/archive/superseded/" — accurate, kept.
- **MIGRATION_REPORT.md / REPO_RESTRUCTURE_PLAN.md** — correctly cite the archived file as the archived file; unchanged.
- **README.md §4+ descriptive manifest** — the §3 tree was updated and a banner flags the lower sections as pre-restructure; the descriptive file-by-file prose was left (no operative impact).
- **No metric definitions, requirements, or architecture were touched** — only names, paths, and counts.

4. Verification (cross-references resolve)

Check	Result
Stale semantic_models.yml as the live registry, in docs/architecture/	0 ✓
Stale semantic_models.yml remaining in live docs	18 — all intentional (the build-warnings + the red-team record + the "archived" note) ✓
Stale flat docs/<DOC>.md paths in live docs	0 ✓
Stale 34 -scenario references in live docs (excl. red-team record)	0 ✓
All 16 referenced canonical paths exist (Test-Path)	16/16 True ✓ — every doc-to-doc reference resolves to a real file.

Conclusion. The live documentation set (root + docs/architecture/ + docs/planning/ + docs/strategy/) now consistently references models/semantic/semantic_layer.yaml (47 metrics / 19 dims), the 50-scenario benchmark, and the post-restructure folder paths. Every cross-reference resolves. The two original M5/M6 blockers the red-team and playbook flagged — the registry-filename drift and the stale paths — are closed.
